FXML

- The syntax is very similar to HTML, but what you actually tell it to do is pretty different
- He's been showing us CSS and how it's compatible with JavaFX for most of the class so I don't really have a lot of notes
- He's currently showing us FXML code. I need to get better at taking notes over people talking about code

JavaScript

- Not connected to Java in anyway
- Also known as ECMAScript
- The main idea is:
 - HTML and CSS are descriptions, not procedures
 - They support dynamic content and interactivity on web pages
 - JavaScript is interpreted and easy to write (weakly typed)
 - It is a full language but has limited libraries - doesn't have I/O, network, or graphics like Java does
